Lab 2: Introduction to R

Joaquin Cavieres

1. Introduction to R

Notation

- The matrices are noted generally with bold font and capital letter : A, B, etc.
- The column vectors are denoted with bold font but with lower case: a, b, etc.
- The elements of a vector \boldsymbol{x} are denoted as $x_1, x_2,, x_m$, etc.
- The elements of a matrix X are denoted as $x_{11}, x_{12},, x_{1m}$, or $x_{11}, x_{21},, x_{mn}$, etc.

Vectors

• A vector \boldsymbol{x} of size m is a column of m elements (numbers):

$$\boldsymbol{x} = \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_m \end{bmatrix}$$

- The numbers x_i are elements of the vector \boldsymbol{x}
- The transpose of the vector \boldsymbol{x} can be expressed as $\boldsymbol{x}^T = (x_1, ..., x_n)$ (a row vector).
- The addition and subtraction of vectors of equals dimension is done element by element:

$$m{x} + m{y} = egin{bmatrix} x_1 + y_1 \ x_2 + y_2 \ dots \ x_m + y_m \end{bmatrix}$$

It is not possible add or subtract vectors with different dimension!.

• The scalar multiplication of a vector is element by element:

$$\lambda \boldsymbol{x} = \begin{bmatrix} \lambda x_1 \\ \lambda x_2 \\ \vdots \\ \lambda x_m \end{bmatrix}$$

for any scalar λ (a real number).

- Two vectors x e y are equals if they have the same dimension and each pair of elements are equals, for example $x_i = y_i$ for i = 1, ..., n.
- The scalar product (inner product) is $\langle \vec{x}, \vec{y} \rangle = \sum_{i=1}^{n} x_i y_i$ (commonly written so by the mathematicians). The statisticians denote this operation as $\mathbf{x}^T \mathbf{y}$.

Example in R: We have the vector $\boldsymbol{x} = (1, 2, 3)^T$ and a vector $\boldsymbol{y} = (4, 5, 6)^T$. The scalar product is: 1*4+2*5+3*6=32.

Building vectors in R

The easy way to create a vector is using the function $c(x_1, x_2, ..., x_n)$, that is:

```
x = c(1,2,3)
x
```

[1] 1 2 3

```
y = c(4,5,6)
y
```

[1] 4 5 6

x y y will be interpreted as a column vector or a row vector depending on the context. We can avoid any ambiguity or error in the declaration of the vector in R using the function matrix (.,.,.), that is:

```
c = matrix(c(6,5,4), nrow=3, ncol=1,byrow=T)
d = matrix(c(3,2,1),3,1, byrow=T)
```

С

```
## [,1]
## [1,] 6
## [2,] 5
## [3,] 4
```

d

```
## [,1]
## [1,] 3
## [2,] 2
## [3,] 1
```

[1,]

3

If we do not use the function matrix (.,.,.) then the vector have a numeric() class (not a matrix expressed as a column vector). Anyway, we can convert the numeric vector to a matrix as:

```
b = c(4,5,6)
b

## [1] 4 5 6

class(b)

## [1] "numeric"

b = as.matrix(b)
b

## [1,1] 4

## [2,1] 5

## [3,1] 6

class(b)

## [1] "matrix" "array"
```

It should be noted that the arguments nrow() and ncol() are assumed by default, but we can change the order of the elements in the matrix:

```
u = matrix(c( 3, 2, 1), 1, 3, byrow=T)
u
## [,1] [,2] [,3]
```

```
v = matrix(c(6,5,4), ncol=1, nrow=3, byrow=T)
v

## [,1]
## [1,] 6
## [2,] 5
## [3,] 4
```

Additional

Other ways to create vectors in R:

```
x = 1:5
## [1] 1 2 3 4 5
x = seq(1,5, by = 0.25)
## [1] 1.00 1.25 1.50 1.75 2.00 2.25 2.50 2.75 3.00 3.25 3.50 3.75 4.00 4.25 4.50
## [16] 4.75 5.00
x = seq(10,1, by =-1)
X
## [1] 10 9 8 7 6 5 4 3 2 1
x = rep(1, times = 5)
## [1] 1 1 1 1 1
length(x)
## [1] 5
rep(x, 2)
## [1] 1 1 1 1 1 1 1 1 1 1
```

```
set.seed(1)  # "seed"
x = sample(1:10, 5)
x
```

[1] 9 4 7 1 2

Operations with vectors:

```
u = 1:5
v = rep(0.5, times = length(u))
u + v

## [1] 1.5 2.5 3.5 4.5 5.5

u * v

## [1] 0.5 1.0 1.5 2.0 2.5

u^v
```

[1] 1.000000 1.414214 1.732051 2.000000 2.236068

Funcionts applied to vectors

```
x = 1:10
sqrt(x)  # square root

## [1] 1.000000 1.414214 1.732051 2.000000 2.236068 2.449490 2.645751 2.828427
## [9] 3.000000 3.162278

sum(x)  # sum

## [1] 55

prod(x)  # product

## [1] 3628800
```

```
mean(x)
                # mean of the vector
## [1] 5.5
var(x)
                  # variance of the vector
## [1] 9.166667
Access to elements of a vector
x=c(3, 2, 1, 7, 5)
                           # to create a vector
x[4]
                           # access to element 4
## [1] 7
x[2];x[5]
                           # access to element 2 and 5
## [1] 2
## [1] 5
x[1:3]; x[c(2,4,5)]
                           # access to sub-vectors
## [1] 3 2 1
## [1] 2 7 5
x[4] = 4
                           # changing the value of an element
## [1] 3 2 1 4 5
x[-5]
                           # remove the element 5
## [1] 3 2 1 4
x = c(x[1:3], 16, x[4:5]) # insert the number 16 between the position 3 and 4
```

Matrices

A matrix is a rectangular structure of real numbers, thus a matrix $X_{m \times n}$ is an rectangular "array" of scalar numbers such that:

$$m{X}_{m imes n} = egin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \ dots & & \ddots & dots \ a_{m1} & a_{m2} & \dots & a_{mn} \end{bmatrix}$$

with m rows and n columns. Commonly the matrix is called of "dimension" or "order" $m \times n$. For the above we can say that X have m and n dimensions. Sometimes the matrix also called denoted

as
$$\boldsymbol{X} = (x_{ij})$$
. For example, $\boldsymbol{X} = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}$

is a matrix of dimension 2×3 . The notation for x_{ij} indicates the elements of X. Other types of characterics are:

- A matrix is **square** if m = n (same number of rows and columns).
- A matrix with elements "0" is denoted as **0**
- A matrix is symmetric if $X = X^T$.
- A square matrix with all elements not on the diagonal equal to 0 is a **matriz diagonal**, for example $x_{ij} = 0$ for all $i \neq j$ (and $x_{ii} \neq 0$ for at least i).
- A diagonal matrix with 1's in the diagonal and all others not on the diagonal 0 is denoted as I_n . This matrix is also kwon as **idetidy matrix**.

$$I_n = egin{bmatrix} 1 & 0 & \dots & 0 \ 0 & 1 & \dots & 0 \ dots & dots & \ddots & dots \ 0 & 0 & \dots & 1 \end{bmatrix}$$

Summary of functions in R for matrices:

- Access to a column of a matrix U, the value $j th \Rightarrow U[j]$
- Access to a sub-set of a rows in a matrix $U \Rightarrow U[i_1 : i_2,]$
- Access to a sub-set of a columns in a matrix $U \Rightarrow U[, j_1 : j_2]$
- Access to a sub-matrix of a matrix $U \Rightarrow U[i_1 : i_2, j_1 : j_2]$
- Sum of $U + V \Rightarrow U + V$
- lacksquare Subtract of $oldsymbol{U} + oldsymbol{V} \Rightarrow \mathtt{U} \mathtt{V}$
- Multiplication of $UV \Rightarrow U\% * \%V$
- Transpose of $U^T \Rightarrow \mathsf{t}(\mathtt{U})$

- $\bullet \ \ \text{Matrix-vector product} \ \boldsymbol{U}^T\boldsymbol{V} \Rightarrow \texttt{crossprod}(\mathtt{U},\mathtt{V})$
- Inverse of a matrix U^{-1} , solve(U)
- Determinant of a matrix U, det(A) or denoted also as $|U| \Rightarrow det(A)$
- lacktriangledown Diagonal fo a matrix $U\Rightarrow \mathtt{diag}(\mathtt{U})$
- Union of matrices by columns U y $V \Rightarrow \text{cbind}(U, V)$
- lacktriangle Union de matrices by rows U y $V\Rightarrow \mathtt{rbind}(\mathtt{U},\mathtt{V})$
- Length of a vector $x \Rightarrow \text{length}(x)$
- lacktriangledown Dimension fo a matrix $U\Rightarrow \dim(\mathtt{U})$

Examples:

```
A = matrix(c(1,2,3,4,5,6),nrow=2,ncol=3,byrow=F)
B = matrix(c(1,2,3,4,5,6),nrow=2,ncol=3,byrow=T)
## [,1] [,2] [,3]
## [1,]
        1 3 5
## [2,] 2 4
## [,1] [,2] [,3]
## [1,] 1
             2
## [2,] 4 5
                  6
A[1, ] # Access to the first row of A
## [1] 1 3 5
B[2, ] # Access to the second row of B
## [1] 4 5 6
A[1, 3] # Access to the element of the row 1 and column 3 of the matrix A
## [1] 5
B[2, 3] # Access to the element of the row 2 and column 3 of the matrix B
## [1] 6
```

Operations with matrices

A + B

```
## [,1] [,2] [,3]
## [1,] 2 5 8
## [2,] 6 9 12
```

A - B

```
## [,1] [,2] [,3]
## [1,] 0 1 2
## [2,] -2 -1 0
```

2*B

Note: If A and B are matrices and we want to multiply A with B, it could be done when the number of columns in A is equal to the number of rows in B.

t(A) # Transpose of A

```
## [,1] [,2]
## [1,] 1 2
## [2,] 3 4
## [3,] 5 6
```

t(A) %* %B # Multiply the transpose of A with B

```
## [,1] [,2] [,3]
## [1,] 9 12 15
## [2,] 19 26 33
## [3,] 29 40 51
```

Dimension and length of the vectors in matrices

```
U = matrix(c(1,2,3,4,5,6),2,3)
```

```
dim(U)  # Dimension of U

## [1] 2 3

dim(t(U))  # Dimension of the transpose of U

## [1] 3 2

length(U)  # Length of the elements in U

## [1] 6
```

For loops in R

A for loop essentially iterates a process a number of times, indexed by a counter variable. The simplest example of a for loop is one which prints the numbers in a vector successively

```
u <- seq(0, 1, length=10)
for(i in 1:10)
{
    print(u[i])
}

## [1] 0
## [1] 0.11111111
## [1] 0.2222222
## [1] 0.3333333
## [1] 0.4444444
## [1] 0.5555556
## [1] 0.6666667
## [1] 0.7777778
## [1] 0.8888889
## [1] 1</pre>
```

To loop over a process that is indexed by more than one number we need to use one loop within another, commonly referred to as a nested loop. For example,

```
A = matrix(0, nrow = 4, ncol = 4)

for(i in 1:4){
  for(j in 1:4){
        A[i,j] = j^i
    }
}
print(A)
```

```
##
         [,1] [,2] [,3] [,4]
## [1,]
                  2
                        3
                             4
            1
## [2,]
            1
                  4
                        9
                            16
## [3,]
                  8
                       27
                            64
            1
## [4,]
            1
                 16
                       81
                           256
```
